Q0:

1) The keys which do not contain all attributes of the relation are superkeys.

2)

a) Student(Name, marks, course)

A = name, B = marks, C = course

$S = A \rightarrow BC$

Since name determine marks and course.

$\{A\}^+ = \{B, C\}$

But here marks and course dont determine any other attribute.

Thus, $\{B\}^+ = \{B\}$ and $\{C\}^+ = \{C\}$

b) Course(Code, name, teacher)

A = Code, B = Course name, C = Course teacher

For $X^+ = \{A, B, C\}$ we need two FD's $A \rightarrow B$ and $B \rightarrow C$

Since course code determines course name ($A \rightarrow B$)

And Course name tells us which teacher teaches we have $B \rightarrow C$

Taking closure for $X = \{A\}$ we get

$X^+ = \{A, B, C\}$ but $X \neq \{A, B, C\}$ here.

Q1

Consider a relation with schema $R(A, B, C, D)$ and FD's $AB \rightarrow C$, $C \rightarrow D$, and $D \rightarrow A$.

a) $AB \rightarrow D$, $C \rightarrow A$, $CD \rightarrow A$, $BC \rightarrow A$, $AC \rightarrow D$, $BD \rightarrow C$, $CD \rightarrow A$, $ABC \rightarrow D$, $ABD \rightarrow C$, $BCD \rightarrow A$

b) $AB^+ = \{A, B, C, D\}$, $BC^+ = \{B, C, D, A\}$, $BD^+ = \{B, D, A, C\}$

Thus AB, BC and BD since they contain all attributes of R

c) ABC, ABD, BCD, and ABCD.

Q2

a) Let $R = \{A_1, A_2, \dots, A_n\}$

This means, $\{A_1, A_2, \dots, A_n\}^+ = \{A_1, A_2, \dots, A_n, B\}$

Considering $A_1, A_2, \dots, A_n, C \rightarrow B$, B is present in the closure of R and thus it will also be present in $\{A_1, A_2, \dots, A_n, C\}^+$

b) From the FD, $\{A_1, A_2, \dots, A_n\}^+ = \{A_1, A_2, \dots, A_n, B\}$, by adding C to both sides we get $A_1, A_2, \dots, A_n, C \rightarrow BC$

- c)
d) Assuming

$$\text{FD } A_1 A_2 \cdots A_n C_1 C_2 \cdots C_k \rightarrow B_1 B_2 \cdots B_m D_1 D_2 \cdots D_j$$

Holds,

If we take closure of $\{A_1, A_2, \dots, A_n\}^+$ from given FD we get $\{A_1, A_2, \dots, A_n\}^+ \rightarrow \{A_1, A_2, \dots, A_n, B_1, B_2, \dots, B_n\}$

The same stands for C. By combining both we prove the initial assumption.

Q3

- A) If $A \rightarrow B$ suppose A stands for StudentID: integer and B stands for name of the student.
In this scenario, each new StudentID refers to a new kid. If we Assumed $B \rightarrow A$ then that would mean 2 or more kids with the same name would have the same studentID which is wrong.
- B) $AB \rightarrow C$ and $A \rightarrow C$ then $B \rightarrow C$
A = studentID
B = Date of application
C = name
In this case, $AB \rightarrow C$ stands both ID and DOB together can identify a student.
 $A \rightarrow C$ is valid too since ID can identify a student
But $B \rightarrow C$ is not valid since DOB can be same for several students can thus cannot determine a unique student
- C) $AB \rightarrow C$, then $A \rightarrow C$ or $B \rightarrow C$
A = pincode
B = street number
C = entry pin
Both AB together will give you correct pin to enter the apartment
But only A wont give you the right one nor only street number(B)
